Bulletin AB01023 Issue/Rev. 0.7 (10/21)

Smith Meter[®] PD Meter Gear Trains

The gear trains presented in tabular form in this bulletin show the gearing used in current models of Smith Meter PD Meters. Former models using the same gearing are listed for reference.

A gear train is a means of transmitting volumetric units, equaling the volume of the metering chamber times the revolution per minute (RPM) of the rotor, to a recording device, which can be a counter mounted directly on the meter or a transmitter mechanically or electrically connected to a remote receiver.

Most meters are available with one of three basic gear trains, which are used to indicate metered volumes in terms of United States, English, or metric units. These basic gear trains are used with Smith Meter manual, ATC, or ATG calibrators requiring 96 percent (%) meter gearing and are designated as “standard gearing.”

“Special gearing” indicates all variations in gearing that are not standard. Special gearing is required in the following instances:

- ATC and ATG calibrators used in meters operating on products metered at temperatures outside the standard 20 degrees Fahrenheit (°F) to 120 °F range (and many high American Petroleum Institute (API) products metered within the 20 °F to 120 °F range) may require special gearing ranging from 82% to 102%, depending on the product and temperature.
- Adapting G-Type calibrators to meters ordinarily using standard manual, ATC, or ATG calibrators requires special 114% ± 1% gearing.
- Meters intended to be used with dummy calibrators usually require 100.0% meter gearing.
- Meters using a D-Type transmitter frequently require 99% meter gearing in order to minimize the pulse effect of standard calibrators that may appear on electronic receivers used with Smith Meter D-Type transmitters.
- Meters that are geared to indicate pounds, kilograms, or long tons are specially geared.

Contents

Meters are listed alphabetically.

Models

F4-V1 and F4-V3

Metered volume per revolution of rotor:

2.000.....US gallon (US gal)

Note: Incorporation of the two miter gears in a standard gear train reverses the direction of rotation at the counter. In the F4-V1 train shown, the idler gear is mounted on the pinion shaft to drive the calibrator gear directly for proper counter registration.
